

INFECTIOUS CANINE DISEASES

Our canine companions could be exposed to serious, potentially deadly diseases every day. Here are just some of the diseases that vaccinations can provide protection against.

Contagious Cough

Often known as 'kennel cough', actually as little as 20% cases are thought to come from kennels.¹

Most dogs catch through daily adventures, such as the park, shops, shared water bowls...

The bacteria that causes it can **survive in water for 6 months.**²

Parvovirus

A common virus which is **usually fatal** without intensive hospital treatment.

Survival rates in untreated dogs are as low as 9%³ and 1 gram of infected faeces can **infect over 10 million** susceptible dogs.⁴

Leptospirosis

Caught from **direct or indirect** contact with dog or rodent urine from water or soil.

Can be **rapidly fatal** in dogs & humans.

Don't wait, vaccinate!

Book your dog's vaccination today.

INFECTIOUS FELINE DISEASES

Our feline companions could be exposed to serious, potentially deadly diseases every day. Here are just some of the diseases that vaccinations can provide protection against.

Cat Flu

Caused by common and **highly contagious** viruses caught through everyday adventures.

Can be tricky to treat initially and affected cats are usually **infected for life** with signs returning at times of stress.

Panleukopaenia

Sometimes called enteritis, this virus can **survive in the environment** for over a year.

Sadly, **less than 50% of cats survive**, even with intensive care treatment.¹
